

STARLINK SET UP

For many privately owned properties in Scotland, internet connectivity and low speeds present a frustrating challenge. Starlink presents an excellent solution. Providing high speed, low latency, broadband internet Starlink uses a network of low orbit satellites to bring impressive broadband speeds.

Objectives

Although this private clients property had a 4G mobile data connection and a broadband connection with BT, they were challenged by low speeds. Frustrated that their internet connection could not support multiple devices and downloads at the same time they were looking for a solution.

The project

Corona IT Solutions replaced the BT broadband with a Starlink set up, leaving the 4G as a backup. The process couldn't be more simple with the client registering on Starlink's website, before informing Corona IT Solutions once their equipment had arrived. Corona IT Solutions then set up and configured the equipment.

Additionally, Corona IT Solutions installed wireless access points within the property, significantly improving the WIFI strength throughout the house. Internet speeds were improved from 5 Mbps download, 1 Mbps upload to an average of 150 Mbps download, 30 Mbps upload with a latency of between 29 and 39 ms.

The client often received visitors so a private guest network was set up to ensure the family network and access to their devices was secure.

Why Corona IT Solutions?

Corona IT Solutions has a flexible and reliable team of experts dedicated to finding solutions to digital challenges.

Always on hand to support clients needs, pre, during and post project, Corona IT Solutions have a proven track record for resolving internet connectivity issues, installing and configuring the right equipment for the job.
